Digital Input Module

The following digital input components are available.

Model	Description	Voltage	Type
3301	Digital Input Module	24 V DC	Commoned
2301	Digital Input Baseplate		Direct Termination

The Digital Input (DI) Module has three independent channels which process all data sent to the module. An ASIC on each channel scans each input point, compiles data, and transmits it to the MPs upon demand. Input data is voted at the MPs before processing to ensure the highest integrity.

The DI Module sustains complete, ongoing diagnostics for each channel. If the diagnostics detect a failure on any channel, the Fault indicator is activated, which in turn activates the system alarm. The Fault indicator points to a channel fault, *not* a complete module failure. The DI Module is guaranteed to operate properly in the presence of a single fault and may continue to operate properly with certain multiple faults.

The DI Module continuously verifies the ability of the system to detect transitions to the opposite state. The DI Module supports hot sparing for online replacement of a faulty module or continuous back-up to an active module. The DI Module is mechanically keyed to prevent improper installation in a baseplate.
